

# Screw Detroit?

A Financial Analysis  
of a Proposed Screw Deal with Detroit

Project 2  
FIN 3250 - Fall 2016  
Southern Utah University  
Prof. Bruce Haslem

Brittany Green  
December 9, 2016

Based on the information provided, I would choose to take on the project to supply Detroit with the machine screws.

Using the information provided in the base case (Tables 1 and 2), my annual operating cash flow will be \$1.18 million dollars per year for each of the five years. The net present value (NPV) of the total cash flows is \$557,851, and the internal rate of return (IRR) is 18.28 percent, which is higher than my required rate of return of 13 percent. Both of these numbers indicate that it will be beneficial for me to take on the project.

Looking at the margins of error creating the worst best case scenario (Table 4), my best case scenario obviously creates an even more positive NPV of almost \$2.5 million and an IRR of 38.65 percent.

The worst case scenario (Table 3) offers a more worrying result; the NPV is negative, meaning I'd stand to lose \$1.38 million of my initial investment, and the IRR of 0.62 percent is far less than the 13 percent required rate of return. Looking at sensitivity analyses and minimum quantities required (Table 7), the most sensitive input (where a change in one unit of that input results in the highest change in NPV and OCF) is selling price; the NPV sensitivity value for selling price is an astonishing 54,517 compared to relatively small numbers for the other questioned inputs. If I'm very concerned about a profitable project based on my analysis, I would consider setting up a contract with Detroit's auto manufacturers that requires screws be sold at at least a certain price. Based on my sensitivity analysis, that minimum price (if all other values are the projected base values) is \$270 per ton.

A sensitivity analysis of NPV and OCF changes based on a change in output level (number of screws provided to Detroit) says that the sensitivity is 58.90 and 168.09, respectively (Tables 5 and 6). The minimum output level is 21, 682 tons of screws. Again, if I'm concerned about Detroit purchasing less than that output, I suggest the company set up a contract that requires a minimum order of screws per year.

Table 1  
Source information

	Base Case	Margin of Error	Worst Case	Best Case	Sensitivity
Length of Project	5 years				
Output	25,000 tons per year				
Initial Investment	\$ 3,600,000	15%	\$ 4,140,000	\$ 3,060,000
